Course 3 Glossary

AWS Generative AI Applications on AWS:

Bringing Ideas to Life Using AI

AI (Artificial Intelligence)

A branch of computer science focused on creating systems capable of performing tasks that require human intelligence, like problem-solving and decision-making.

AI Agents

Autonomous systems powered by AI models, which can perform tasks on behalf of users, such as generating responses or managing processes.

Amazon Bedrock

A fully managed service by AWS that enables users to create and deploy generative AI applications using various AI models.

Amazon DynamoDB

A fully managed NoSQL database service from AWS, used for storing and managing data in AI-driven applications.

Amazon Partner Network (APN)

A global community of AWS partners who help customers build, manage, and optimize AWS-based solutions.

Amazon Q Developer

A conversational AI assistant integrated into development workflows, assisting with tasks like code generation, debugging, and architecture guidance.

API (Application Programming Interface)

A set of protocols that allow software applications to communicate with each other and share data or functionality.

CLI (Command Line Interface)

A text-based tool used for interacting with software and executing commands on a computer.

Cloud Infrastructure

The physical and virtual resources (like servers and storage) required to support and deploy AI applications and services, often provided through platforms like AWS.

Course 3 Glossary

AWS Generative AI Applications on AWS:

Bringing Ideas to Life Using AI

Custom Models

AI models that are specifically trained or fine-tuned for a particular task, providing tailored solutions beyond general-purpose models.

Fine-Tuning

The process of adjusting a pre-trained AI model to perform better on specific tasks by providing it with additional data or modifying its parameters.

Functions

Blocks of code designed to perform specific tasks, often used to modularize code and make it more maintainable.

IDE (Integrated Development Environment)

An integrated development environment (IDE) is a software application that helps programmers develop software code efficiently.

Low-Code / No-Code Platforms

Tools that allow users to build applications with minimal coding, often used for rapid prototyping or creating simple solutions. (Examples: AWS Honeycode or Amazon AppFlow)

MVP (Minimum Viable Product)

The most basic version of a product with the essential features required to meet early users' needs and test a concept.

Privacy & Governance

The practices ensuring that data used in AI applications is handled securely and complies with legal and ethical standards, such as GDPR.

Refactoring

The process of restructuring existing code to improve its readability, efficiency, or maintainability without changing its functionality.

Course 3 Glossary

AWS Generative AI Applications on AWS:

Bringing Ideas to Life Using AI

Responsible AI

The practice of ensuring AI systems are used ethically, transparently, and fairly, with considerations for privacy, bias, and accountability.

Security & Compliance

Measures and practices that ensure AI applications meet security standards and comply with relevant regulations, such as data encryption and user consent.

Token Consumption

The amount of tokens (units of text) a language model processes during an interaction, including both the input prompt and the generated output.

Use Case

A specific scenario or application where AI technology is used to address a problem or improve aprocess.

Vector Databases

A database specifically designed for storing and querying vectorized data so that AI models can search and retrieve similar items efficiently.

Vector Embeddings

Numerical representations of data (text, images, or audio) that capture meaning or content in a format machines can understand.
